equation

François-Xavier
Vialard

Sur la géométrie différentielle des groupes de Lie de dimension infinie et ses applications à l'hydrodynamique des fluides parfaits,
Ann. Inst. Fourier, 1966.

Theorem

The incompressible Euler equation is the geodesic flow of the (right-invariant) L^2 Riemannian metric on $\text{SDiff}(M)$ (volume preserving diffeomorphisms).

Arnold's remark on incompressible Euler

Sur la géométrie différentielle des groupes de Lie de dimension infinie et ses applications à l'hydrodynamique des fluides parfaits,
Ann. Inst. Fourier, 1966.

Theorem

The incompressible Euler equation is the geodesic flow of the (right-invariant) L^2 Riemannian metric on $\text{SDiff}(M)$ (volume preserving diffeomorphisms).

- An intrinsic point of view by Ebin and Marsden, *Groups of diffeomorphisms and the motion of an incompressible fluid*, Ann. of Math., 1970. Short time existence results for smooth initial conditions.
- An extrinsic point of view by Brenier, relaxation of the variational problem, optimal transport, polar factorization.

Arnold's remark continued

The incompressible Euler equation on M (Eulerian form),

$$\begin{cases} \partial_t v(t, x) + v(t, x) \cdot \nabla v(t, x) = -\nabla p(t, x), & t > 0, x \in M, \\ \operatorname{div}(v) = 0, \\ v(0, x) = v_0(x), \end{cases} \quad (1)$$

is the Euler-Lagrange equation for the action

$$\int_0^1 \int_M |v(t, x)|^2 dx dt, \quad (2)$$

under the flow constraint

$$\begin{aligned} \partial_t \varphi(t, x) &= v(t, \varphi(t, x)), \\ \operatorname{div}(v) &= 0. \end{aligned}$$

and time boundary value constraints:

$$\varphi(0, \cdot) = \varphi_0 \in \operatorname{SDiff}(M) \text{ and } \varphi(1, \cdot) = \varphi_1 \in \operatorname{SDiff}(M). \quad (3)$$

Arnold's remark continued

Rewritten in terms of the flow φ , the action reads

$$\int_0^1 \int_M |\partial_t \varphi(t, x)|^2 dx dt, \quad (4)$$

under the constraint

$$\varphi(t) \in \text{SDiff}(M) \text{ for all } t \in [0, 1]. \quad (5)$$

Arnold's remark continued

Rewritten in terms of the flow φ , the action reads

$$\int_0^1 \int_M |\partial_t \varphi(t, x)|^2 dx dt, \quad (4)$$

under the constraint

$$\varphi(t) \in \text{SDiff}(M) \text{ for all } t \in [0, 1]. \quad (5)$$

Riemannian submanifold point of view:

Let $M \hookrightarrow \mathbb{R}^d$ be isometrically embedded: A smooth curve $c(t) \in M$ is a geodesic if and only if $\ddot{c} \perp T_c M$.

Incompressible Euler in Lagrangian form:

$$\begin{cases} \ddot{\varphi} = -\nabla p \circ \varphi \\ \varphi(t) \in \text{SDiff}(M). \end{cases} \quad (6)$$

About Brenier's approach to incompressible Euler

Variational approach to minimizing geodesics on $\text{SDiff}(M)$
isometrically embedded in a Hilbert space.

- Projection onto $\text{SDiff}(\mathbb{R}^d)$ leads to his polar factorization theorem:

Polar factorization, Y. Brenier 1991

Let $\psi \in L^2(\mathbb{R}^d, \mathbb{R}^d)$ s.t. $\psi_*(\text{Leb}) \ll \text{Leb}$, then there exists a unique couple (p, φ) (up to cste on p) s.t.

$$\psi = \nabla p \circ \varphi, \quad (7)$$

and $\varphi_*(\text{Leb}) = \text{Leb}$ and p is a convex function. Moreover,

$$\|\psi - \varphi\|_{L^2} = \inf_f \{\|\psi - f\|_{L^2} : f_*(\text{Leb}) = \text{Leb}\} \quad (8)$$

- Smooth solutions of Euler are minimizing (for $t \in [0, 1]$) if $\nabla^2 p$ is bounded in L^∞ (by π).
- In general, relaxation of the boundary value problem as (infinite) multimarginal optimal transport.

A geometric picture: Otto's Riemannian submersion

Figure – A Riemannian submersion: $\text{SDiff}(M)$ as a Riemannian submanifold of $L^2(M, M)$: Incompressible Euler equation on $\text{SDiff}(M)$

Reminders: Riemannian submersion

Let (M, g_M) and (N, g_N) be two Riemannian manifolds and $f : M \mapsto N$ a differentiable mapping.

Definition

The map f is a Riemannian submersion if f is a submersion and for any $x \in M$, the map $df_x : \text{Ker}(df_x)^\perp \mapsto T_{f(x)}N$ is an isometry.

- $\text{Vert}_x := \text{Ker}(df(x))$ is the vertical space.
- $\text{Hor}_x \stackrel{\text{def.}}{=} \text{Ker}(df(x))^\perp$ is the horizontal space.
- Geodesics on N can be lifted "horizontally" to geodesics on M .

Theorem (O'Neill's formula)

Let f be a Riemannian submersion and X, Y be two orthonormal vector fields on M with horizontal lifts \tilde{X} and \tilde{Y} , then

$$K_N(X, Y) = K_M(\tilde{X}, \tilde{Y}) + \frac{3}{4} \|\text{vert}([\tilde{X}, \tilde{Y}])\|_M^2, \quad (9)$$

where K denotes the sectional curvature and vert the orthogonal projection on the vertical space.

A general framework

Definition (Infinitesimal cost)

An infinitesimal cost is $f : M \times \mathbb{R} \times \mathbb{R}^d \times \mathbb{R} \rightarrow \mathbb{R}_+ \cup \{+\infty\}$ such that for all $x \in M$, $f(x, \cdot, \cdot, \cdot)$ is convex, positively 1-homogeneous, lower semicontinuous and satisfies

$$f(x, \rho, m, \mu) \begin{cases} = 0 & \text{if } (m, \mu) = (0, 0) \text{ and } \rho \geq 0 \\ > 0 & \text{if } |m| \text{ or } |\mu| > 0 \\ = +\infty & \text{if } \rho < 0. \end{cases}$$

Definition (Dynamic problem)

For $(\rho, m, \mu) \in \mathcal{M}([0, 1] \times M)^{1+d+1}$, let

$$J(\rho, m, \mu) \stackrel{\text{def.}}{=} \int_0^1 \int_M f(x, \frac{d\rho}{d\lambda}, \frac{dm}{d\lambda}, \frac{d\mu}{d\lambda}) d\lambda(t, x) \quad (16)$$

The dynamic problem is, for $\rho_0, \rho_1 \in \mathcal{M}_+(M)$,

$$C(\rho_0, \rho_1) \stackrel{\text{def.}}{=} \inf_{(\rho, \omega, \zeta) \in \mathcal{CE}_0^1(\rho_0, \rho_1)} J(\rho, \omega, \zeta). \quad (17)$$

Geometry of a cone

- Change of variable: $WF^2 = \frac{1}{2}r^2g + 2dr^2$.
- Non complete metric space: add the vertex $M \times \{0\}$.
- The distance:

$$d((x_1, m_1), (x_2, m_2))^2 = m_2 + m_1 - 2\sqrt{m_1 m_2} \cos\left(\frac{1}{2}d_M(x_1, x_2) \wedge \pi\right). \quad (19)$$

- Curvature tensor: $R(\tilde{X}, e) = 0$ and $R(\tilde{X}, \tilde{Y})\tilde{Z} = (R_g(X, Y)Z - g(Y, Z)X + g(X, Z)Y, 0)$.
- $M = \mathbb{R}$ then $(x, m) \mapsto \sqrt{me}^{ix/2} \in \mathbb{C}$ local isometry.

Corollary

If (M, g) has sectional curvature greater than 1, then $(M \times \mathbb{R}_+^*, mg + \frac{1}{4m} dm^2)$ has non-negative sectional curvature. For X, Y two orthonormal vector fields on M ,

$$K(\tilde{X}, \tilde{Y}) = (K_g(X, Y) - 1) \quad (20)$$

where K and K_g denote respectively the sectional curvatures of $M \times \mathbb{R}_+^*$ and M .

Right-invariant metric on a Lie group

From unbalanced optimal transport to the Camassa-Holm equation

François-Xavier Vialard

Definition (Right-invariant metric)

Let $g_1, g_2 \in G$ be two group elements, the distance between g_1 and g_2 can be defined by:

$$d^2(g_1, g_2) = \inf_{g(t)} \left\{ \int_0^1 \|v(t)\|_{\mathfrak{g}}^2 dt \mid g(0) = g_0 \text{ and } g(1) = g_1 \right\}$$

where $\partial_t g(t)g(t)^{-1} = v(t) \in \mathfrak{g}$, with \mathfrak{g} the Lie algebra.

Unbalanced optimal transport

An isometric embedding

Euler-Arnold-Poincaré equation

The Camassa-Holm equation as an incompressible Euler equation

Corresponding polar factorization

Right-invariant metric on a Lie group

From unbalanced optimal transport to the Camassa-Holm equation

François-Xavier Vialard

Definition (Right-invariant metric)

Let $g_1, g_2 \in G$ be two group elements, the distance between g_1 and g_2 can be defined by:

$$d^2(g_1, g_2) = \inf_{g(t)} \left\{ \int_0^1 \|v(t)\|_{\mathfrak{g}}^2 dt \mid g(0) = g_0 \text{ and } g(1) = g_1 \right\}$$

where $\partial_t g(t)g(t)^{-1} = v(t) \in \mathfrak{g}$, with \mathfrak{g} the Lie algebra.

Right-invariance means:

$$d^2(g_1 g, g_2 g) = d(g_1, g_2).$$

It comes from:

$$\partial_t(g(t)g_0)(g(t)g_0)^{-1} = \partial_t g(t)g_0 g_0^{-1} g(t)^{-1} = \partial_t g(t)g(t)^{-1}.$$

$$(\text{Diff}(M), H^{\text{div}}) \hookrightarrow L^2(M, \mathcal{C}(M)) \quad (34)$$

- 1 Using Gauss-Codazzi formula, it generalizes a curvature formula by Khesin et al. obtained on $\text{Diff}(S_1)$.
- 2 Smooth geodesics are length minimizing for a short enough time under mild conditions (generalization of Brenier's proof).
- 3 The Camassa-Holm equation as incompressible Euler.
- 4 A new polar factorization theorem.

Generalisation of Brenier's proof

Theorem (P2)

Let $(\varphi(t), r(t))$ be a smooth solution to the geodesic equations on the time interval $[t_0, t_1]$. If $(t_1 - t_0)^2 \langle w, \nabla^2 \Psi_{P(t)}(x, r) w \rangle < \pi^2 \|w\|^2$ holds for all $t \in [t_0, t_1]$ and $(x, r) \in \mathcal{C}(M)$ and $w \in T_{(x,r)}\mathcal{C}(M)$, then for every smooth curve $(\varphi_0(t), r_0(t)) \in \text{Aut}_{\text{vol}}(\mathcal{C}(M))$ satisfying $(\varphi_0(t_i), r_0(t_i)) = (\varphi(t_i), r(t_i))$ for $i = 0, 1$ and the condition (*), one has

$$\int_{t_0}^{t_1} \|(\dot{\varphi}, \dot{r})\|^2 dt \leq \int_{t_0}^{t_1} \|(\dot{\varphi}_0, \dot{r}_0)\|^2 dt, \quad (35)$$

with equality if and only if the two paths coincide on $[t_0, t_1]$.

Define $\delta_0 \stackrel{\text{def.}}{=} \min\{r(x, t) : \text{injectivity radius at } (\varphi(t, x), r(t, x))\}$, then the condition (*) is:

- 1 If the sectional curvature of $\mathcal{C}(M)$ can assume both signs or if $\text{diam}(M) \geq \pi$, there exists δ satisfying $0 < \delta < \delta_0$ such that the curve $(\varphi_0(t), r_0(t))$ has to belong to a δ -neighborhood of $(\varphi(t), r(t))$, namely

$$d_{\mathcal{C}(M)}((\varphi_0(t, x), r_0(t, x)), (\varphi(t, x), r(t, x))) \leq \delta$$

for all $(x, t) \in M \times [t_0, t_1]$ where $d_{\mathcal{C}(M)}$ is the distance on the cone.

- 2 If $\mathcal{C}(M)$ has non positive sectional curvature, then, for every δ as above, there exists a short enough time interval on which the geodesic will be length minimizing.
- 3 If $M = S_d(1)$, the result is valid for every path $(\dot{\varphi}_0, \dot{r}_0)$.

Answer

The cone $\mathcal{C}(M)$ is a trivial principal fibre bundle over M .
The automorphism group $\text{Aut}(\mathcal{C}(M)) \subset \text{Diff}(\mathcal{C}(M))$ can be
identified with $\text{Diff}(M) \times C^\infty(M, \mathbb{R}_+^*)$. One has
 $(\varphi, \lambda) : (x, r) \mapsto (\varphi(x), \lambda(x)r)$.

Recall that $\psi \in \text{Aut}(\mathcal{C}(M))$ if $\psi \in \text{Diff}(\mathcal{C}(M))$ and $\forall \lambda \in \mathbb{R}_+^*$ one
has $\psi(\lambda \cdot (x, r)) = \lambda \cdot \psi(x, r)$ where $\lambda \cdot (x, r) \stackrel{\text{def.}}{=} (x, \lambda r)$.

CH as an incompressible Euler equation

The geodesic equation on $\text{Diff}(M) \times C^\infty(M, \mathbb{R}_+^*)$ can be extended to $\text{Aut}(\mathcal{C}(M))$ as

$$\frac{D}{Dt}(\dot{\varphi}, \dot{\lambda}r) = -\nabla \Psi_P \circ (\varphi, \lambda r), \quad (37)$$

where $\Psi_P(x, r) \stackrel{\text{def.}}{=} r^2 P(x)$.

Theorem (Polar factorization, P2)

Let $(\phi, \lambda) \in \overline{\text{Aut}}(\mathcal{C}(M))$ s.t. $\rho_1 = \pi_0 [(\phi, \lambda), \text{vol}]$ is an absolute continuous admissible measure. Then, there exist a unique minimizer, characterized by a c -concave function z_0 , between vol and ρ_1 and a unique measure preserving generalized automorphism $(s, \sqrt{\text{Jac}(s)}) \in \overline{\text{Aut}}_{\text{vol}}(\mathcal{C}(M))$ such that vol a.e.

$$(\phi, \lambda) = \exp^{\mathcal{C}(M)} \left(-\frac{1}{2} \nabla p_{z_0}, -p_{z_0} \right) \circ (s, \sqrt{\text{Jac}(s)}) \quad (42)$$

or equivalently

$$(\phi, \lambda) = \left(\varphi, e^{-z_0} \sqrt{1 + \|\nabla z_0\|^2} \right) \cdot (s, \sqrt{\text{Jac}(s)}), \quad (43)$$

where $p_{z_0} = e^{z_0} - 1$ and

$$\varphi(x) = \exp_x^M \left(-\arctan \left(\frac{1}{2} \|\nabla z_0(x)\| \right) \frac{\nabla z_0(x)}{\|\nabla z_0(x)\|} \right). \quad (44)$$

Moreover $(s, \sqrt{\text{Jac}(s)})$ is the unique $L^2(M, \mathcal{C}(M))$ projection of (ϕ, λ) onto $\overline{\text{Aut}}_{\text{vol}}(\mathcal{C}(M))$.

Polar factorization

From unbalanced
optimal transport to
the Camassa-Holm
equation

François-Xavier
Vialard

Another formulation of the polar factorization:

Corollary (P2)

Denote by $\text{Mes}^1(\mathcal{C}(M)) \mathbb{R}_+^*$ the space of measurable and approximate differentiable functions $f : \mathcal{C}(M) \mapsto \mathbb{R}$ that satisfy $f(x, r) = r^2 f(x, 1)$ for any $r \in \mathbb{R}_+^*$. Under the hypothesis of the previous theorem, there exists a unique couple

$\left((s, \sqrt{\text{Jac}(s)}), \Psi_P \right) \in \overline{\text{Aut}}_{\text{vol}} \times \text{Mes}^1(\mathcal{C}(M)) \mathbb{R}_+^*$ such that

$$(\phi, \lambda) = \exp^{\mathcal{C}(M)}(-\nabla \Psi_P) \circ (s, \sqrt{\text{Jac}(s)}), \quad (45)$$

where $\Psi(x, r) = r^2 z_0(x)$.

Euler-Arnold-Poincaré equation

The Camassa-Holm equation as an incompressible Euler equation

Corresponding polar factorization

Polar factorization as extension of the Hodge-Helmholtz decomposition:

$$v = w + \nabla p \text{ where } \operatorname{div}(v) = 0. \quad (46)$$

In our case,

$$(v(\theta), r\lambda(\theta)) = \left(w(\theta), \frac{r}{2} \operatorname{div}(w(\theta)) \right) + \left(\frac{1}{2} \nabla p(\theta), rp(\theta) \right). \quad (47)$$

A word about smoothness: Monge-Ampère equation

The corresponding Monge-Ampère equation can be written as

$$\det \left[-\nabla^2 z(x) + (\nabla_{xx}^2 c)(x, \varphi(x)) \right] = |\det [(\nabla_{x,y} c)(x, \varphi(x))]| e^{-2z(x)} \left(1 + \frac{1}{4} \|\nabla z(x)\|^2 \right) \frac{f(x)}{g \circ \varphi(x)}, \quad (48)$$

where φ is the c -exponential of $-z$:

$$\varphi(x) = \exp_x^M \left(-\arctan \left(\frac{1}{2} \|\nabla z(x)\| \right) \frac{\nabla z(x)}{\|\nabla z(x)\|} \right). \quad (49)$$

A word about smoothness: Monge-Ampère equation

The corresponding Monge-Ampère equation can be written as

$$\det \left[-\nabla^2 z(x) + (\nabla_{xx}^2 c)(x, \varphi(x)) \right] = |\det [(\nabla_{x,y} c)(x, \varphi(x))]| e^{-2z(x)} \left(1 + \frac{1}{4} \|\nabla z(x)\|^2 \right) \frac{f(x)}{g \circ \varphi(x)}, \quad (48)$$

where φ is the c -exponential of $-z$:

$$\varphi(x) = \exp_x^M \left(-\arctan \left(\frac{1}{2} \|\nabla z(x)\| \right) \frac{\nabla z(x)}{\|\nabla z(x)\|} \right). \quad (49)$$

For the cost $c(x, y) = -\log(\cos^2(d(x, y) \wedge \pi/2))$,

- On the plane, there exist $(x, y) \in M^2$ and $(v, w) \in T_x M \times T_y M$, $\text{MTW}(x, y, v, w) < 0$.
- On the sphere of radius $r = 1$, as well.
- If r small enough, then numerically, $\text{MTW} \geq 0$.

Link with the reflector problem

From unbalanced
optimal transport to
the Camassa-Holm
equation

François-Xavier
Vialard

Consider the sphere of radius $1/2$, then $d(x, y) = \frac{1}{2} \arccos(x \cdot y)$:

$$\begin{aligned} -\log(\cos^2(d(x, y))) &= -\log(1 + \cos(2d(x, y))) + \log(2) \\ &= -\log(1 + x \cdot y) + \log(2) \\ &= -2 \log(|x + y|) = 2c_r(x, -y) \end{aligned}$$

The cost for the reflector antenna is $c_r(x, y) = -\log(|x - y|)$.
Clearly,

$$\operatorname{sgn}(\operatorname{MTW}(c_r(\cdot, \cdot))) = \operatorname{sgn}(\operatorname{MTW}(c_r(\cdot, -\cdot)))$$

Therefore, $\operatorname{MTW}(-\log(\cos^2(d))) \geq 0$ on the sphere of radius $1/2$.
