

From the city to the street: modeling at a finer grain ... yes but how? (air quality modeling)

Fabien Brocheton – NUMTECH
& INRIA Innovation Lab with CLIME

Content

- NUMTECH
- Evolution of needs about urban air quality and tools used in the past
- and Now ?

NUMTECH

- **Age** : 16 years of expertise
- **Activity** : Atmospheric modelling (air-quality, meteorology, ...)
- **Location** : Clermont-Fd (Head), PACA and Ile de France (Campus Ter@tec)
- **Size** : 18 people
- **Cluster** : SYSTEM@TIC, SAFE, CEREALES VALLEES
- **Turn-over** : ~ 1,3 M€
- **R&D Partnership** : INRIA, LISA, LAMP, LSCE, ...

Meteorology

- Consulting (EIA, ...)
- Expertise and Training
- Conception and distribution of applications
- Data provider

Air-quality

CONTEXT

Context of urban air-quality

❑ Historical request:

- Annual statistics according to regulatory thresholds
- Survey of specific sites

⇒ **Measurement alone (permanent or temporary) were sufficient to give answer**

CONTEXT

Context of urban air-quality

- ❑ Fifteen years ago, new request:
 - High detailed cartography of concentrations
 - General assessment of sources contribution to air-quality
 - Environmental impact assessment study of new construction
 -

But we were face to

- ❑ Complex phenomenology of urban scale
 - Flow and dispersion around complex geometry: buildings, trees, exchange between streets, ...
 - Urban meteorological processes (thermal effect,)
 - Various sources of air pollution
 - Etc.
- ❑ And operational limitations
 - Engineering needs to simulate some scenarios in an “acceptable” cpu time
 - On simple server
 - Whereas Thousands buildings and streets, moving vehicles and potential receptors must be taken into account

⇒ **Specific “simplified” Urban air-quality models have been developed and are used by environmental agencies , engineering companies,**

Urban air-quality models

Natural,
Residential,
Tertiary
... sources

Roads

Industry

Airplane,
Ships, ...

Cadastre
(sum + others)

Topography,
land-use

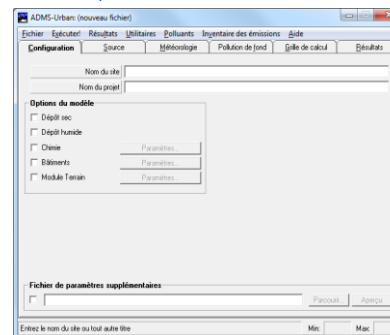

Urban buildings

Background pollution

Meteorological data

Urban air-quality models

« Simplified modelling but requesting to taken into account all sources »

Explicit modelling of all sources as much as possible and regular cadastre

Explicit modelling of only main road sources and regular cadastre (1km)

Explicit modelling of only main road sources

Mean annual concentration of NO₂

Pollution de fond : non

Cadastre d'émission : domaine CPA

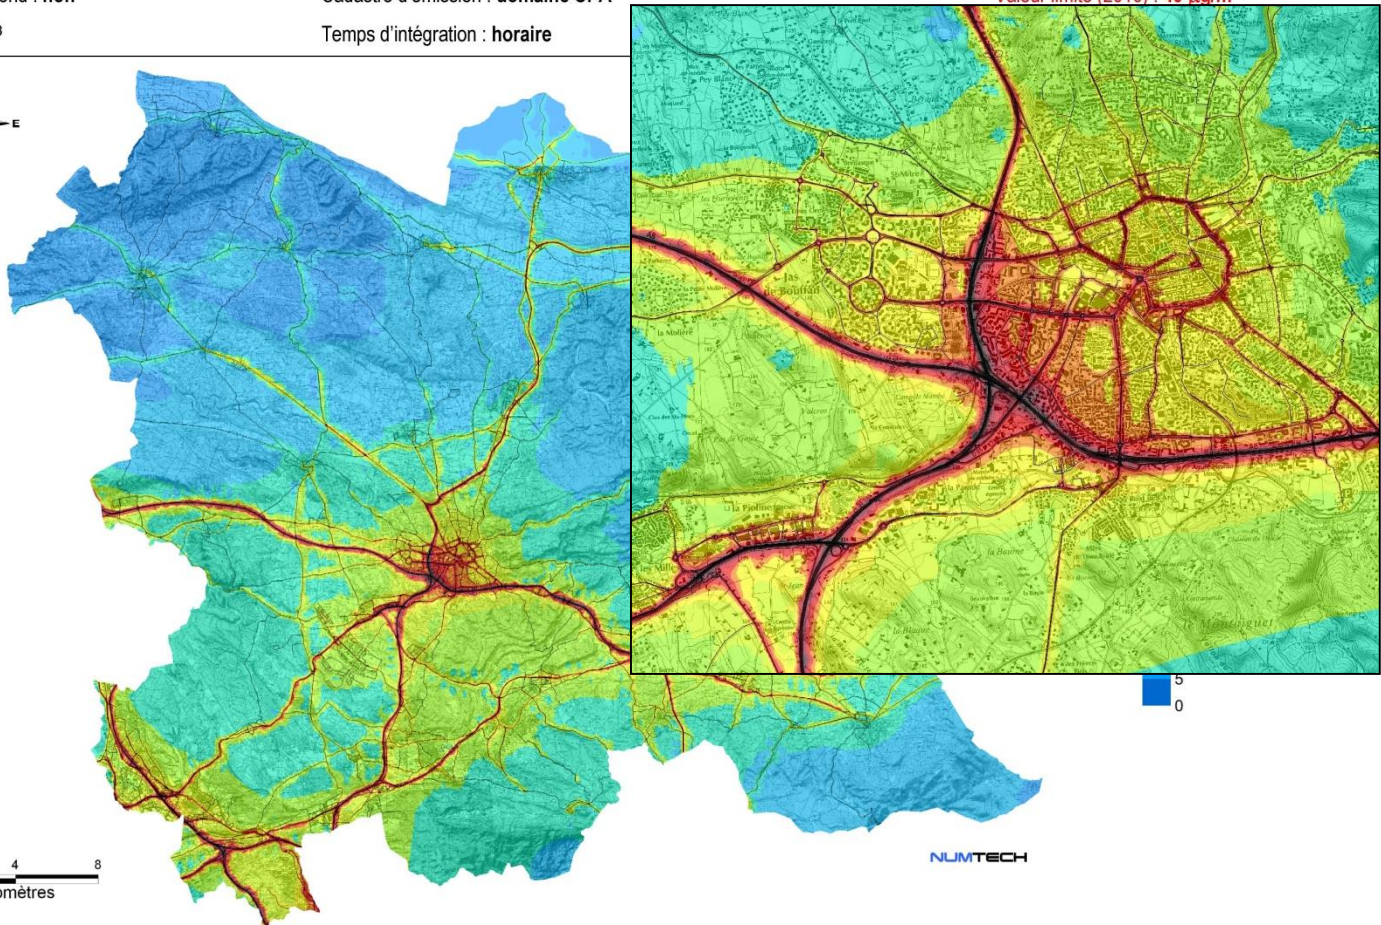

Unité : $\mu\text{g}/\text{m}^3$

Temps d'intégration : horaire

Valeur limite (2010) : $40 \mu\text{g}/\text{m}^3$

Urban air-quality models

Population exposure
and
health impact assesment

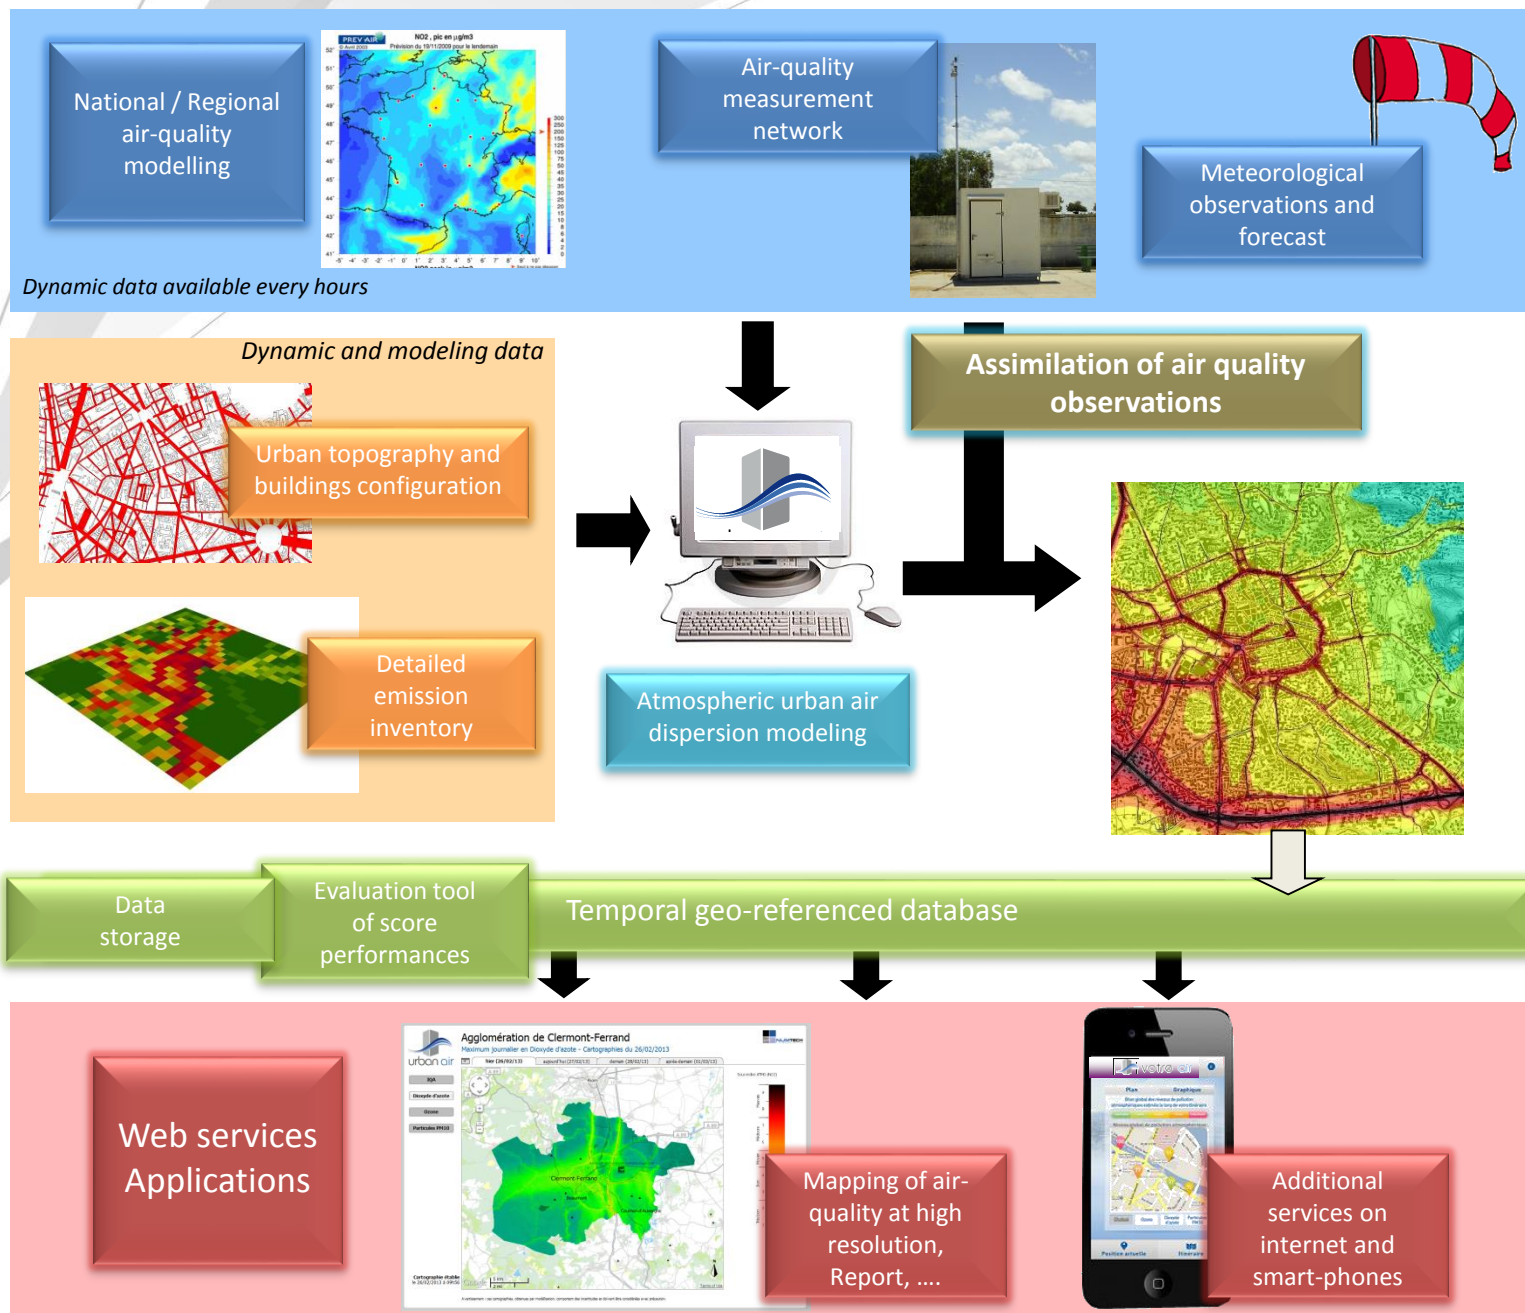

Few years ago, “real-time” needs appear:

- Prediction and operational control
 - Near Real-time survey of pollution
 - Forecast of air-quality for the next days with emission scenario measures (reduce speed, ...)
- Active communication to the public

⇒ **Development of operational systems**

Urban'Air (developed by NUMTECH)

- Realtime traffic emission calculation coupled to realtime airquality modelling

- Reference allocated traffic for specific hours/days

- Traffic counts

238 counts
for IDF

421 counts
for Paris

Traffic
Model
(iterations)

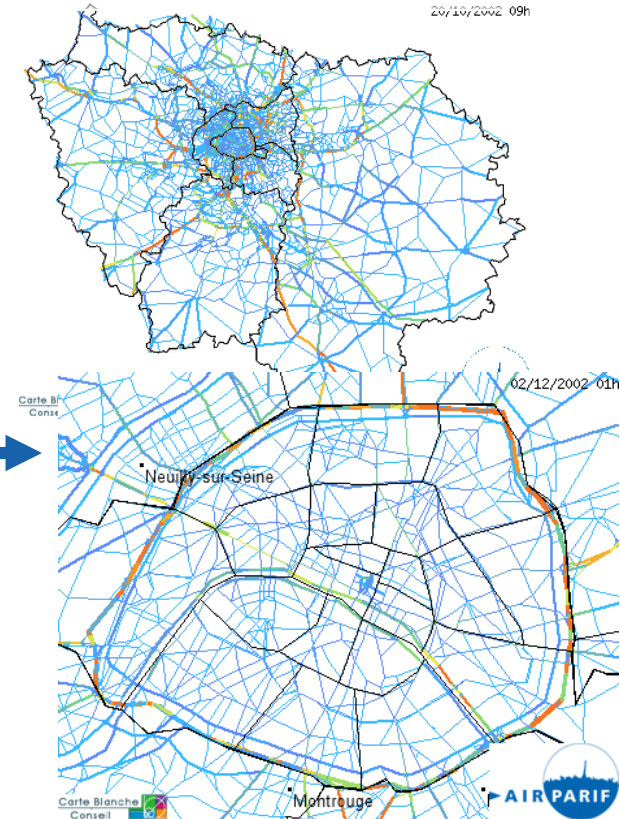

- # of vehicles, average speed
- Cold start %
- Hourly description
- Meteorology

Emissions factors
(Copert IV)

Running fleet based on
local and national data
(ADEME/INRETS)

Allocated traffic data
for 10000 km of roads every hour

Traffic emissions
every hour

Agglomération de Lille

Indice de la Qualité de l'Air du 06/11/2013

Indice de la Qualité de l'Air

Ozone

Particules PM10

Dioxyde d'azote

Prévision établie le 07/11/2013 à 14h08
Prochaine mise à jour : 27/11/2013 13h

Zone survolée

Conception : NUMTECH

Cartographies réalisées avec le soutien du Conseil Régional du Nord-Pas-de-Calais

And now ?

- ❑ More and more detailed information are available:
 - Urban topography (buildings, streets, trees, ...)
 - Emission data (road traffic data, ...)
 - Open data (or not ..., but available)

- ❑ New requests/applications:
 - Uncertainties quantifications
 - Individual exposure / health industry
 - Online coupling with urban planning systems
 - Real-time decision applications (alternative mobility paths, ...)

And now ?

- Need = obtain this map in few seconds in a robust way ...

And now ?

- Need = obtain this map in few seconds in a robust way ...

- To do that, new “tools” to combine:
 - CFD models (but CPU time consuming), and simplified models yet useful
 - Dense air-quality monitoring network (low&mid-cost sensors, fixed or mobile, ...)
 - Numericals methods (ensemble aggregation, assimilation, emulation,)
 - Easy access to HPC services and Cloud
