

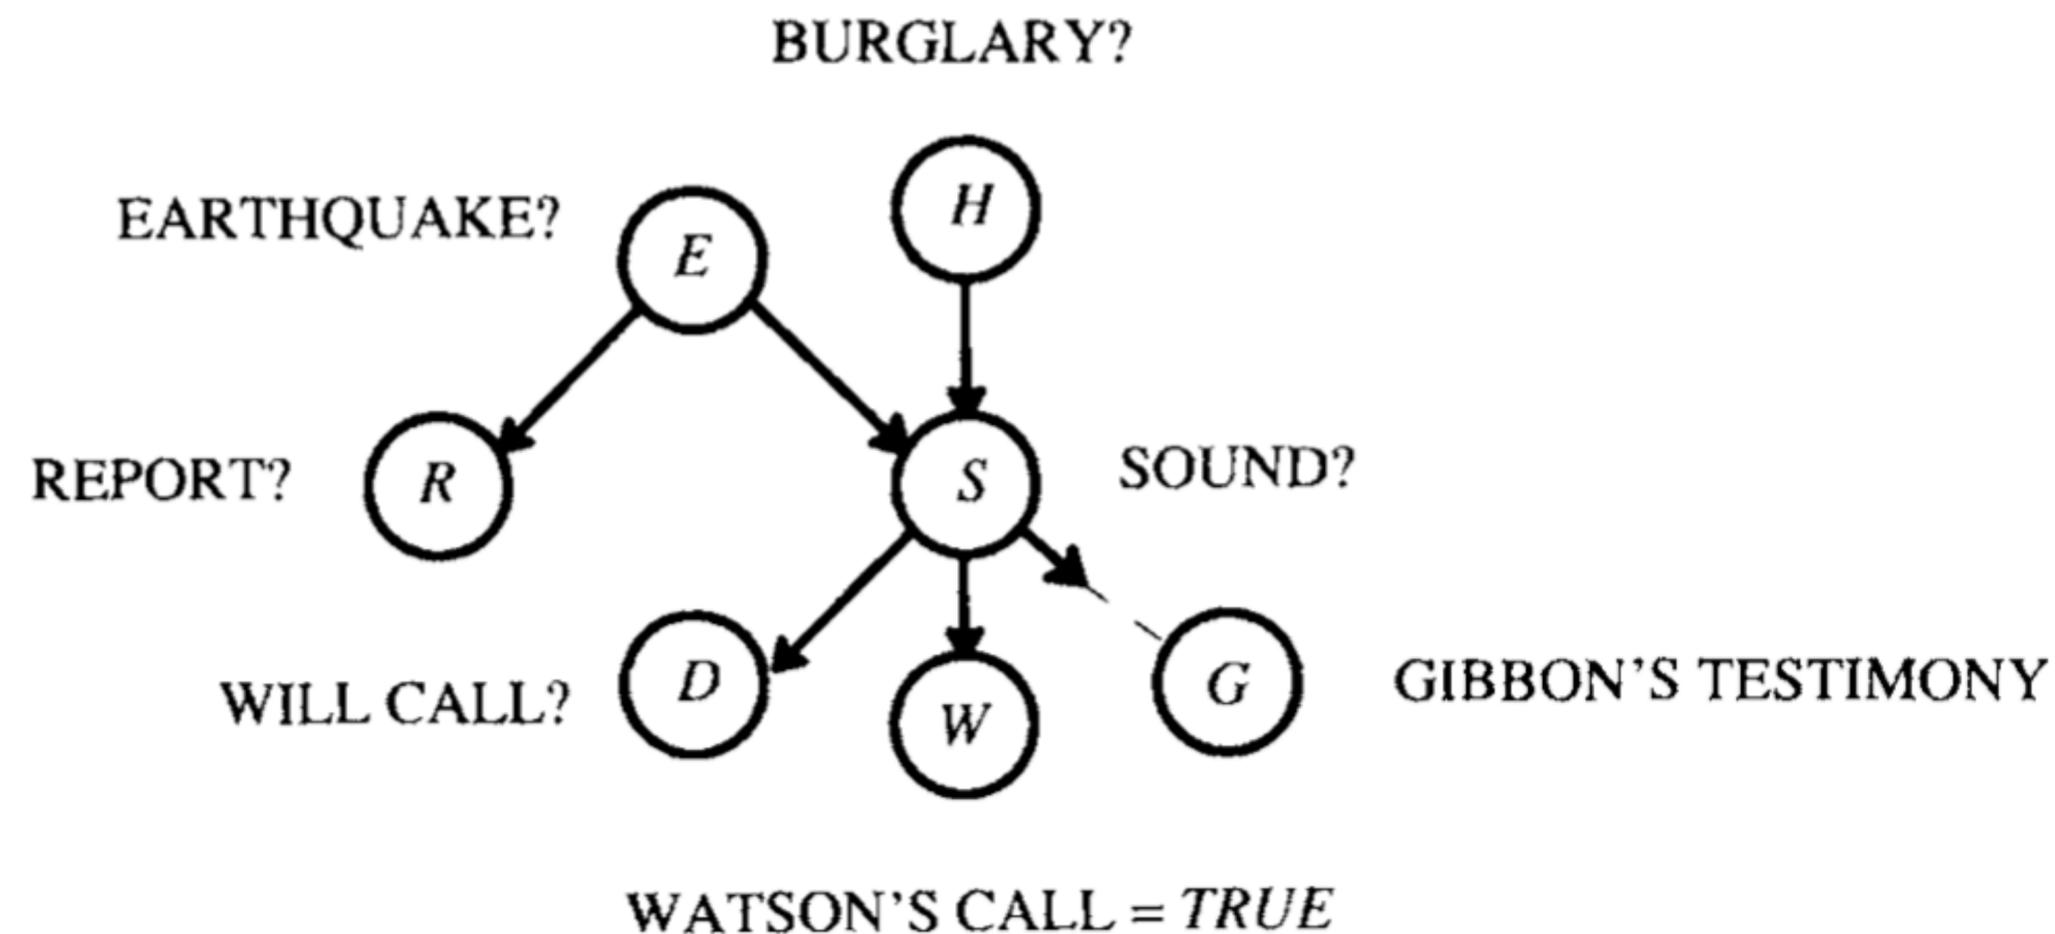

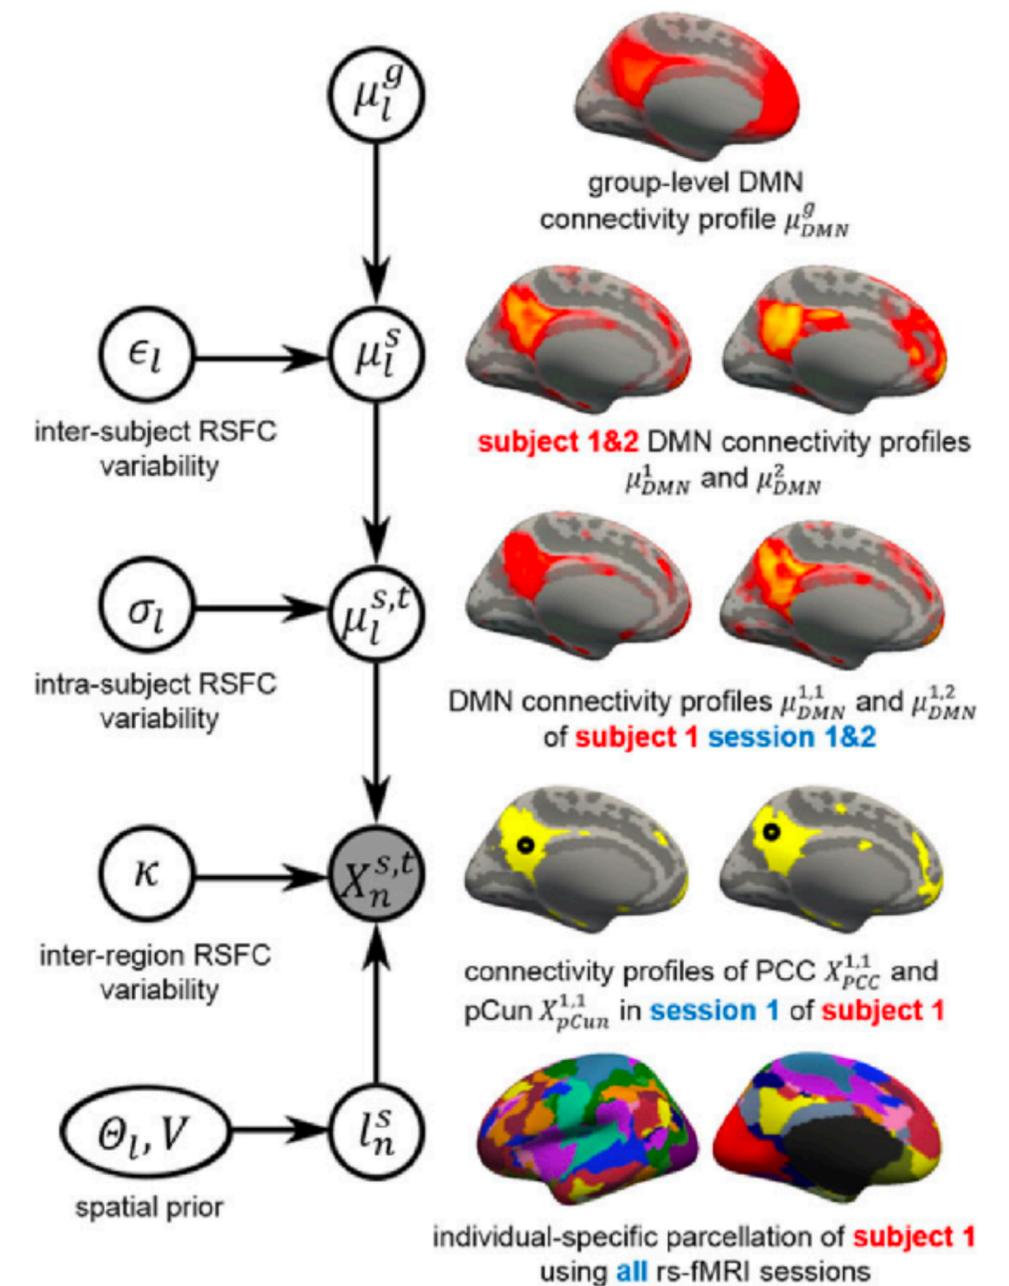

Graphical Models and Simulation-Based Inference

Graphical Models: Discrete Inference and Learning

Introduction to DAG and their relationship with Probability Functions (Pearl)

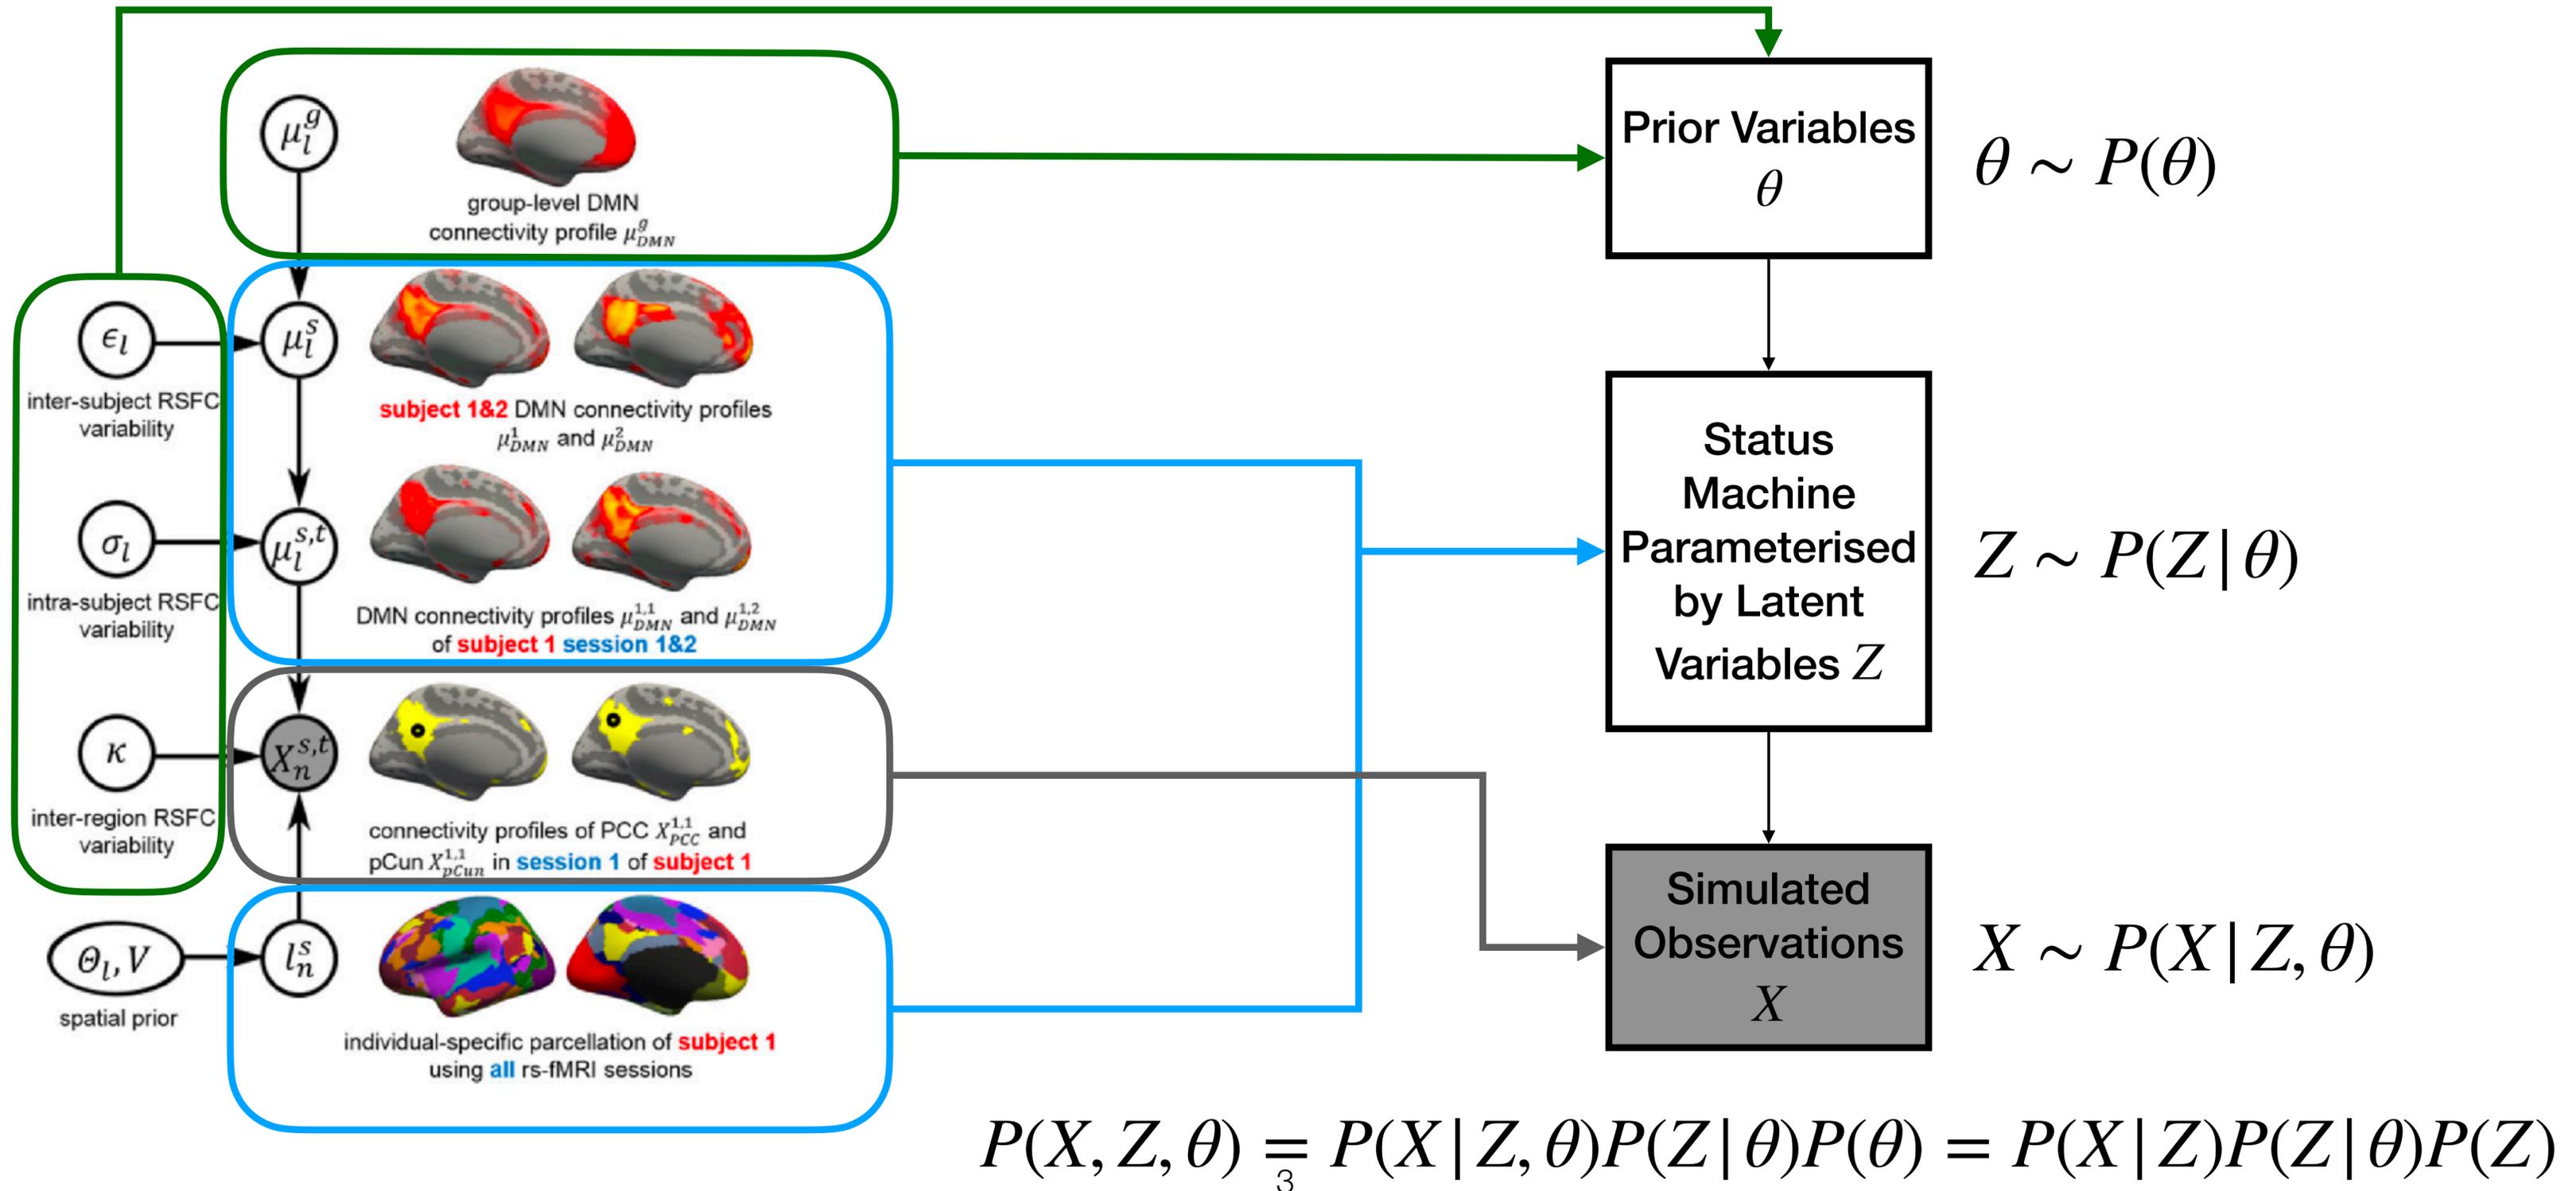

[Pearl 1987]

[Kong et al 2019]

Graphical Models and Simulation Systems

General Inference Notation

θ : parameters X : observations

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

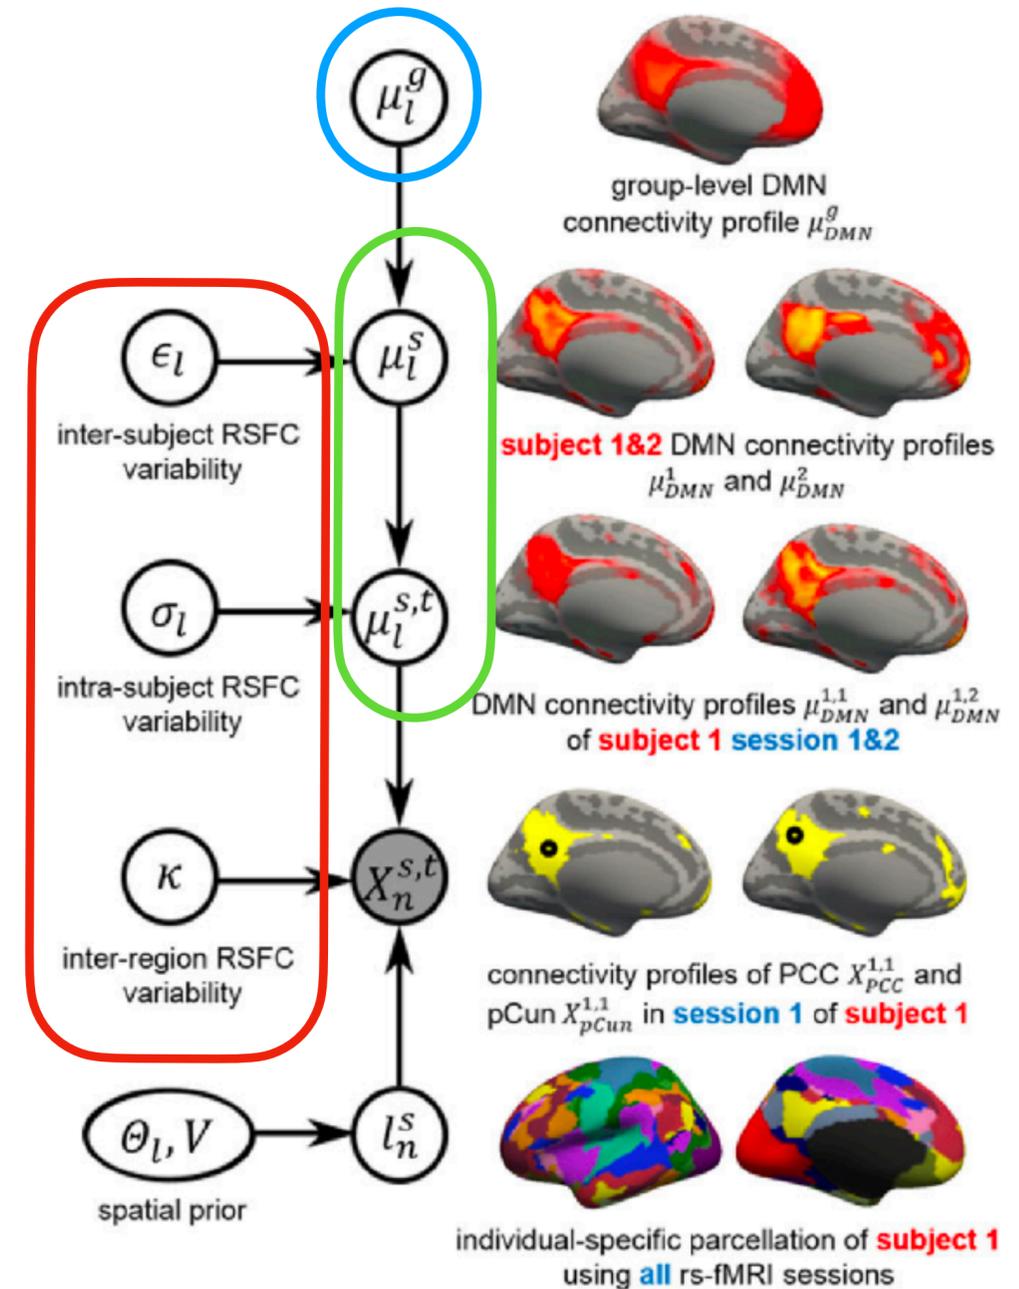

Posterior

Z : latent random variables

$$P(\theta | X) = \frac{\mathbb{E}_Z[P(X | Z, \theta)]P(\theta)}{P(X)}$$

η : nuisance random variables

$$P(\theta | X) = \frac{\mathbb{E}_\eta[P(X | \theta, \eta)]P(\theta)}{P(X)}$$

General Inference Notation

θ : parameters X : observations

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

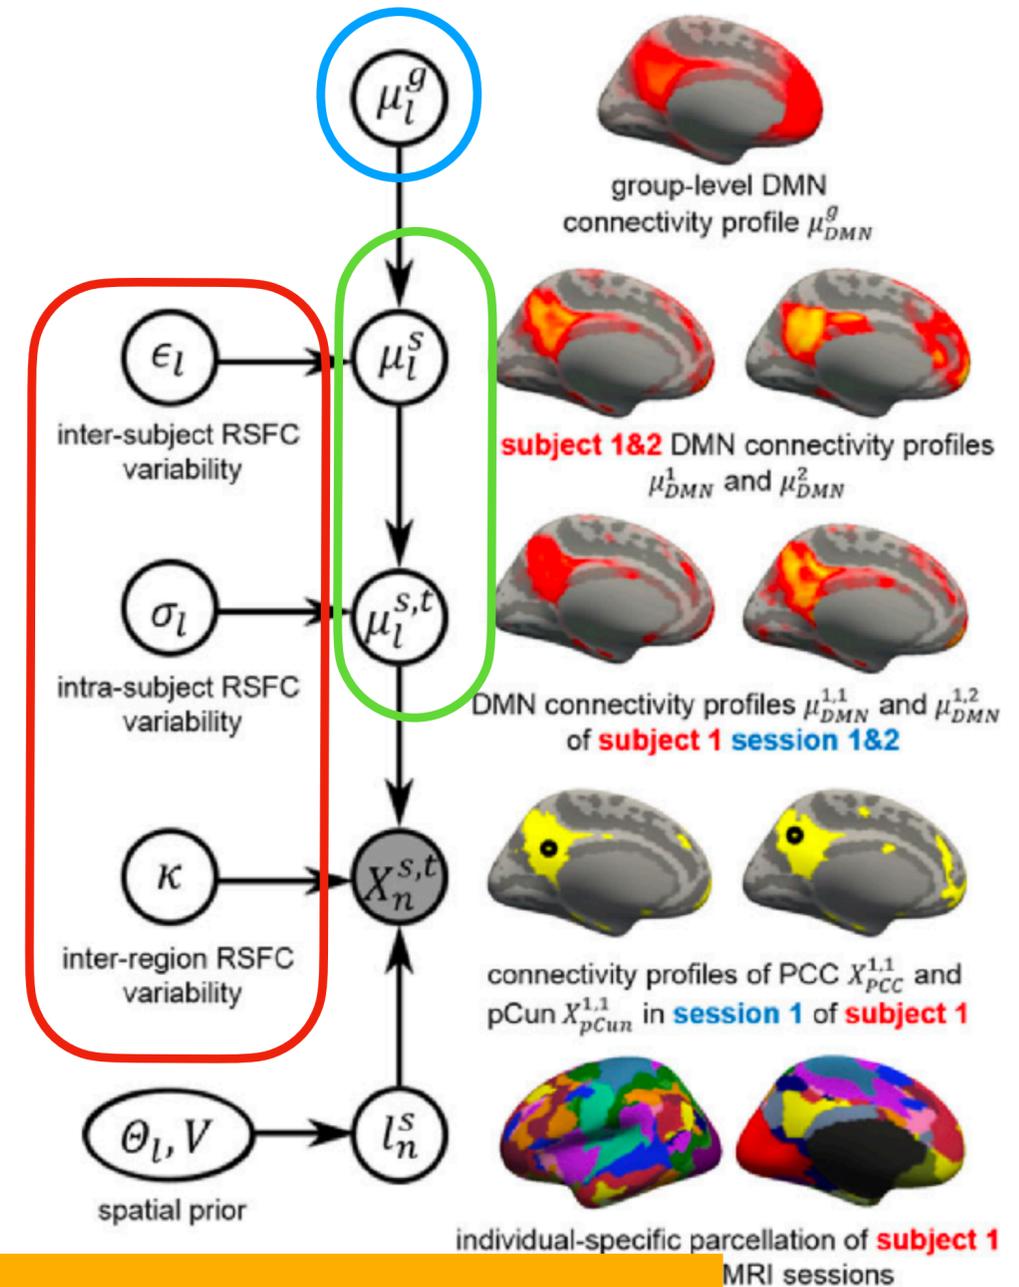

Posterior

Z : latent random variables

$$P(\theta | X) = \frac{\mathbb{E}_Z [P(X | Z, \theta)] P(\theta)}{P(X)}$$

η : nuisance random variables

$$P(\theta | X) = \frac{\mathbb{E}_\eta [P(X | \theta, \eta)] P(\theta)}{P(X)}$$

Intractable in general:
full likelihood impossible to be evaluated or computation cost is extremely high

Likelihood computation is hard: Enter Mechanistic, Example Models Galton Board

θ : parameters X : observations

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

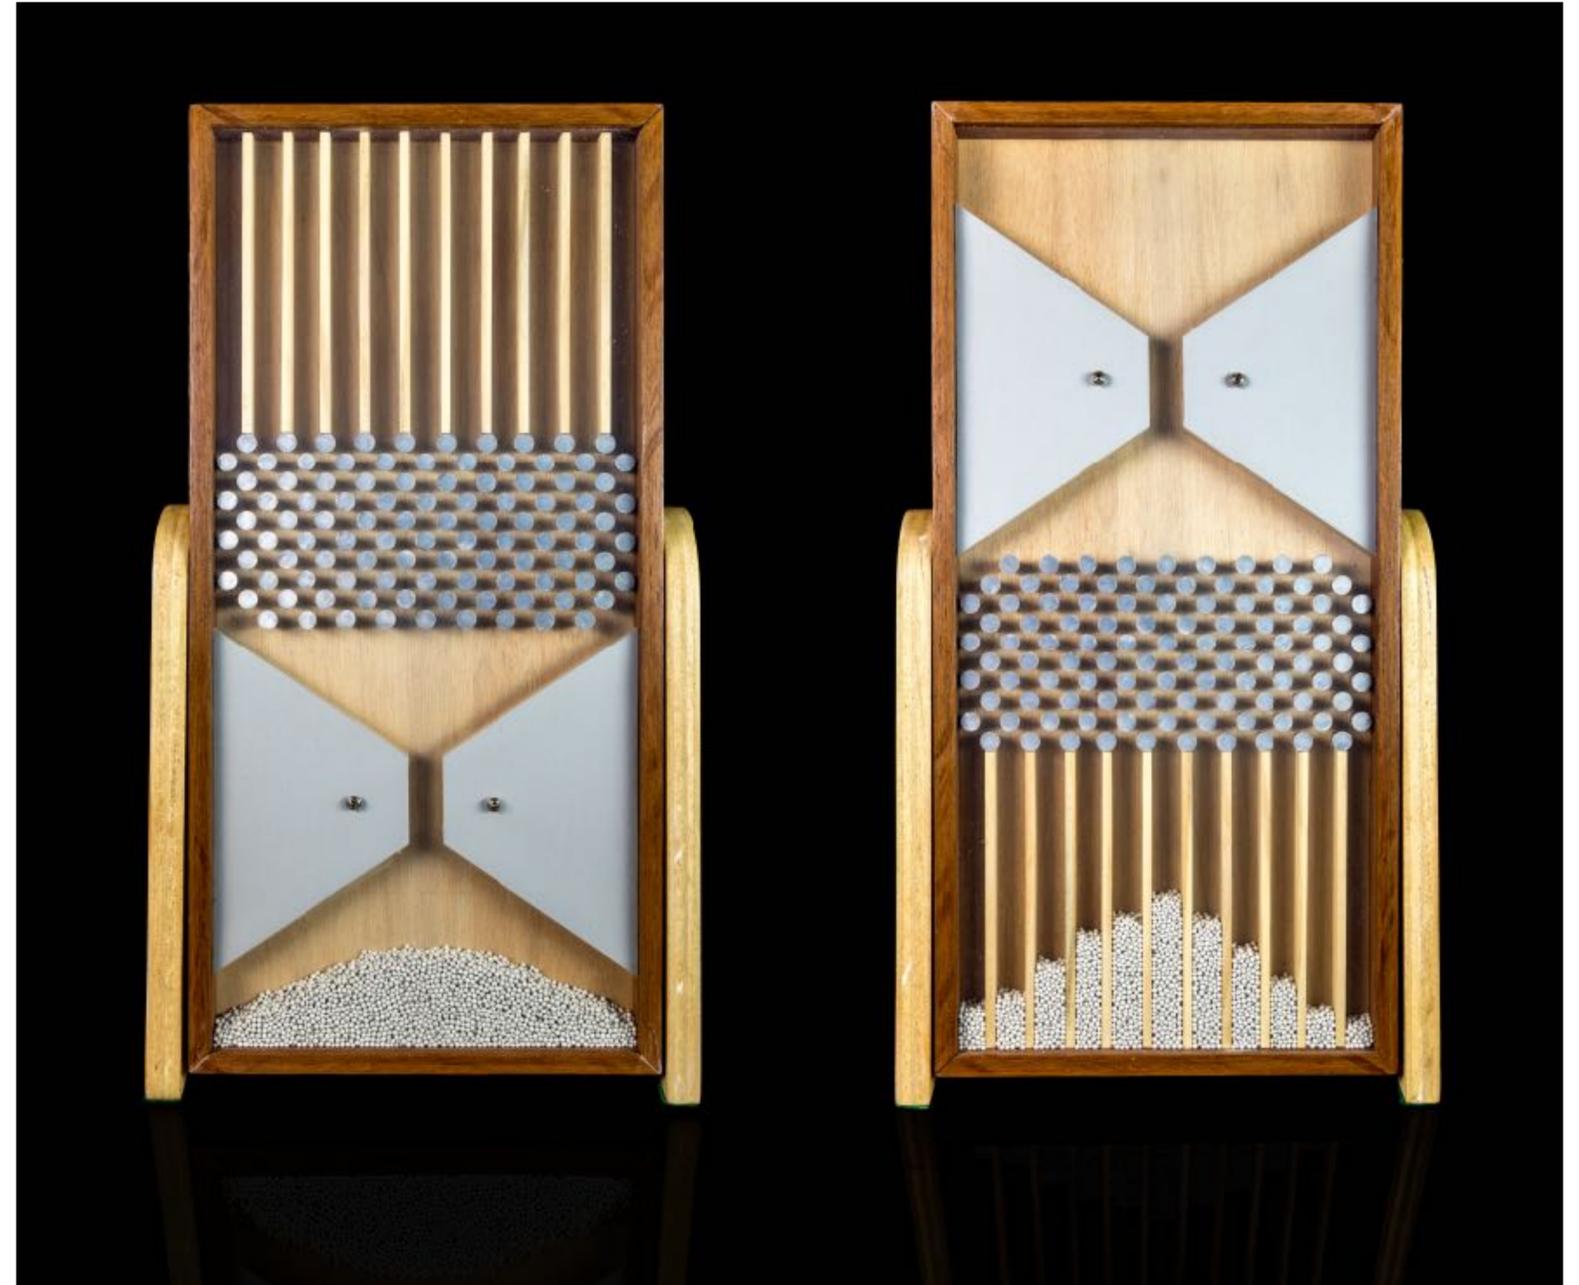

Posterior

Z : latent random variables

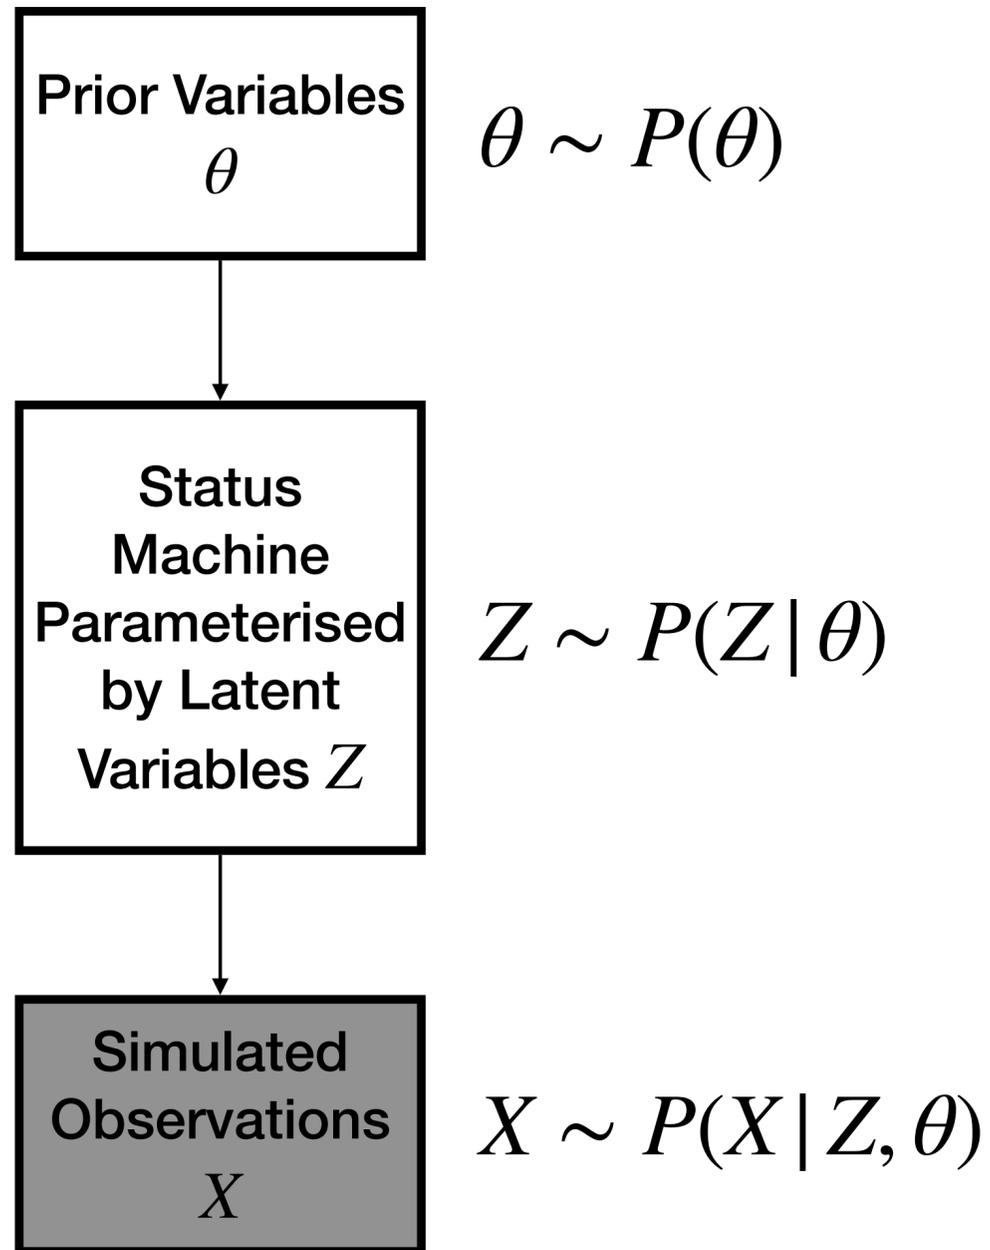

$$P(\theta | X) = \frac{\mathbb{E}_Z [P(X | Z, \theta)] P(\theta)}{P(X)}$$

η : nuisance random variables

$$P(\theta | X) = \frac{\mathbb{E}_\eta [P(X | \theta, \eta)] P(\theta)}{P(X)}$$

Simulation-Based Inference

- Inference is defined as finding the θ that could be at the origin of an observation X . Specifically computing $P(\theta | X) = \mathbb{E}_Z[P(\theta, Z | X)]$
- For this, we use Bayes
$$P(\theta, Z | X) = \frac{P(X | Z, \theta)P(Z, \theta)}{P(X)}$$
, nonetheless the likelihood $P(X | Z, \theta)$ is often unknown or intractable.
- Hence simulation-based inference either approximates or eliminates the need for an explicit likelihood by simulating observations.

Simulation-Based Inference: Neural Network Approximations

Prior Variables
 θ

$$\theta \sim P(\theta)$$

Status
Machine
Parameterised
by Latent
Variables Z

$$Z \sim P(Z | \theta)$$

Simulated
Observations
 X

$$X \sim P(X | Z, \theta)$$

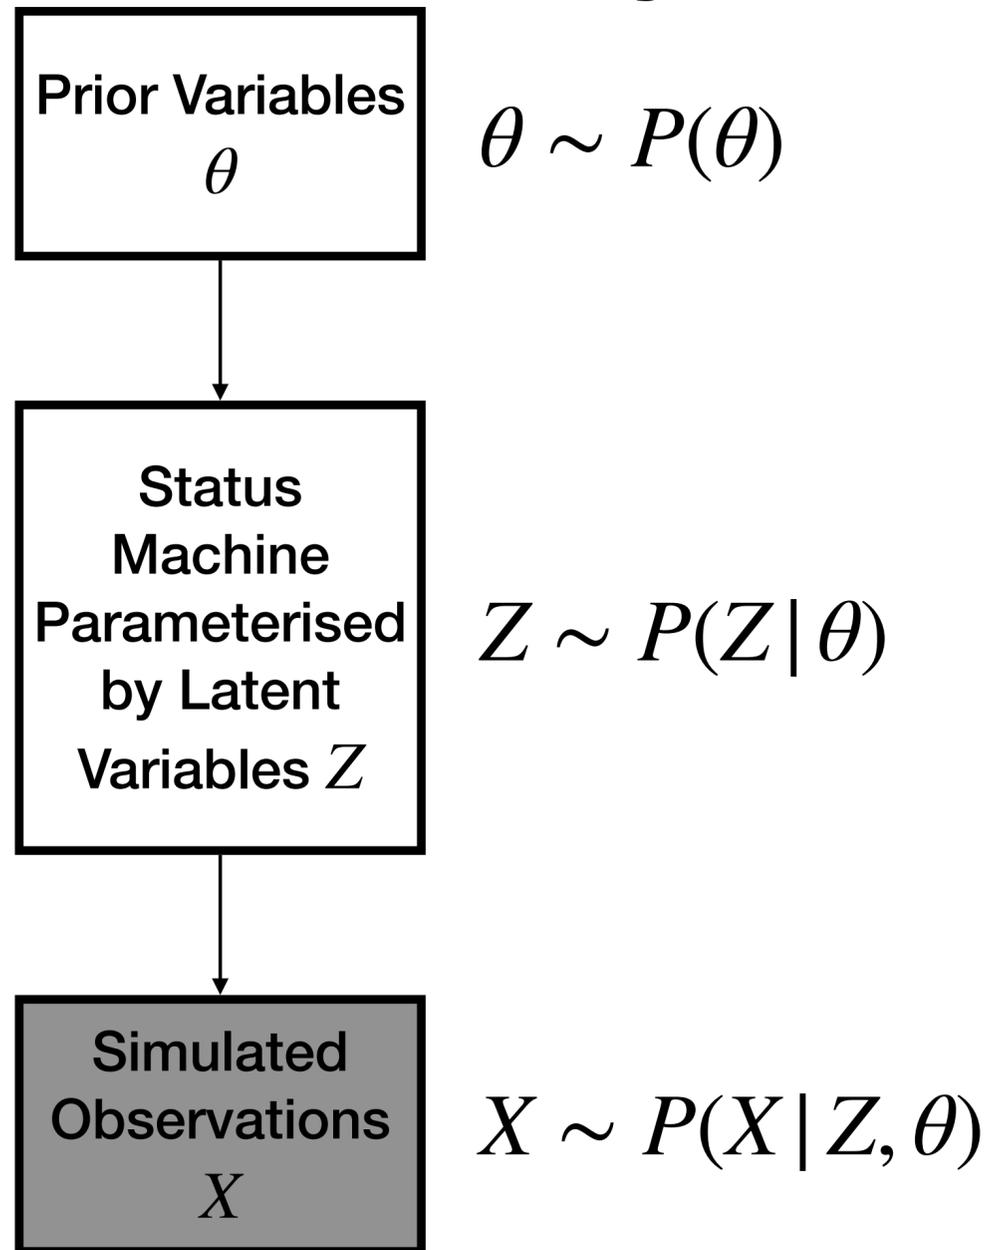

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

θ : parameters X : observations

Posterior

- $P(\theta | X)$ approximated through “Neural Posterior” estimators
- $P(X | \theta)$ approximated through “Neural Likelihood” estimators
- $\frac{P(X | \theta)}{P(X)}$ approximated through the “Neural ratio” estimators

Simulation-Based Inference: Why now it works (Cranmer et al 2019)

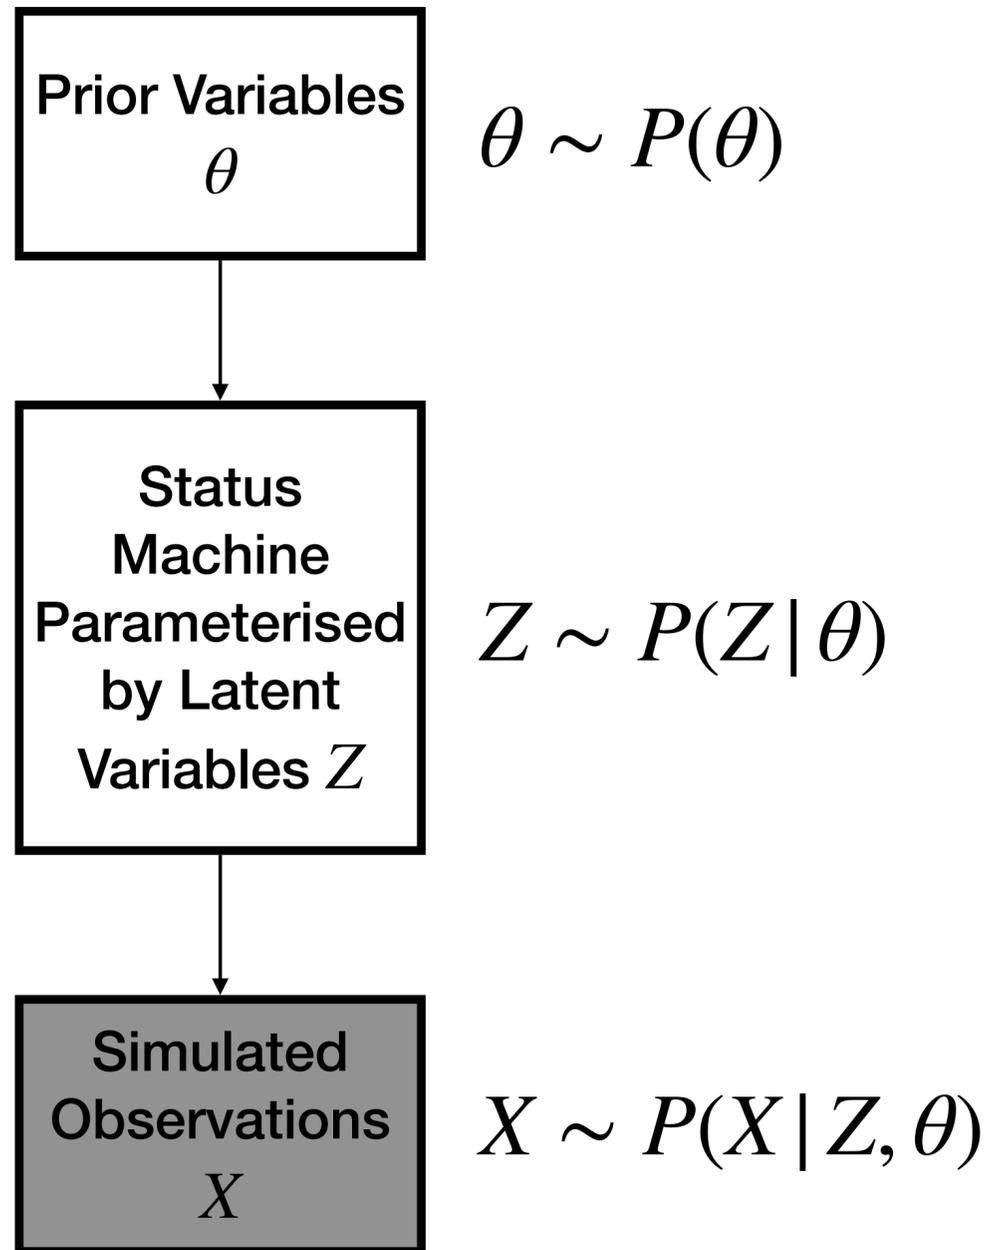

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

θ : parameters X : observations

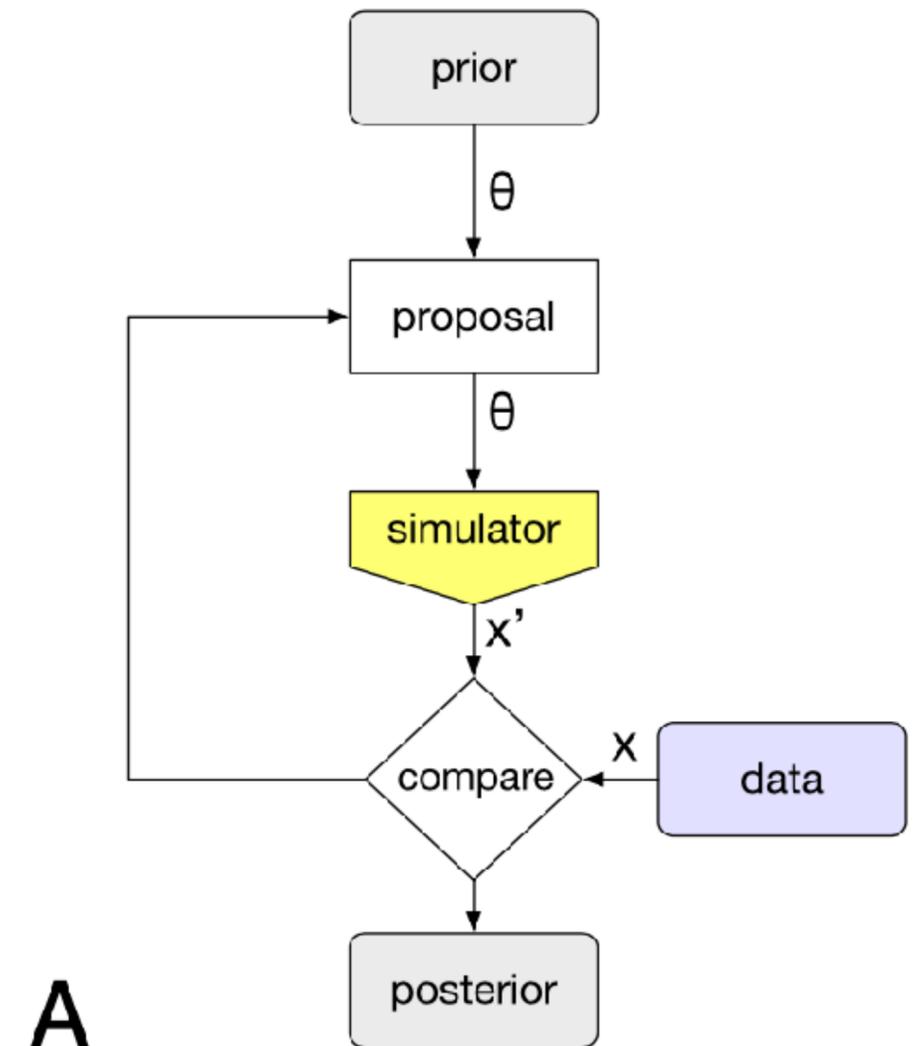

Posterior

- Novel ML-based approaches allow us to massively generate simulated observations
- Autodifferentiation and neural network approaches are great non-linear function estimators
- Active learning can help improving sampling efficiency much better than Markov Chains

Simulation-Based Inference: Neural Network Approximations

Prior Variables
 θ

$$\theta \sim P(\theta)$$

Status
Machine
Parameterised
by Latent
Variables Z

$$Z \sim P(Z | \theta)$$

Simulated
Observations
 X

$$X \sim P(X | Z, \theta)$$

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

θ : parameters X : observations

- $P(\theta | X)$ approximated through “Neural Posterior” estimators
- $P(X | \theta)$ approximated through “Neural Likelihood” estimators
- $\frac{P(X | \theta)}{P(X)}$ approximated through the “Neural ratio” estimators

Simulation-Based Inference: Neural Network Approximations Through Stochastic Flows

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

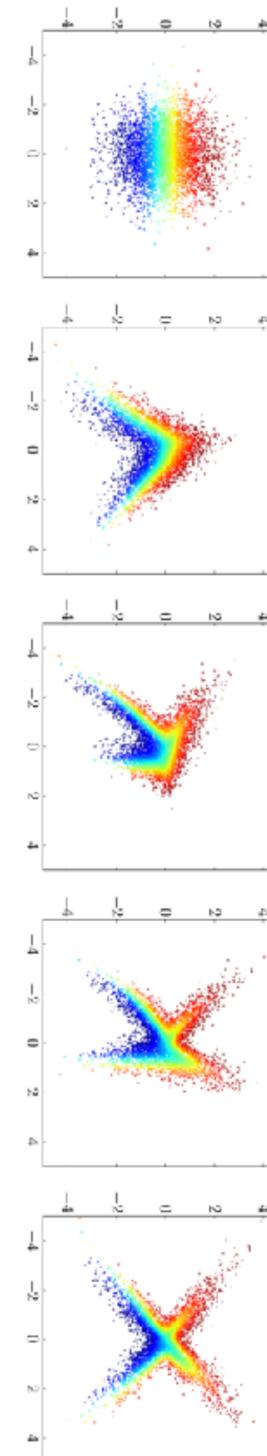

θ : parameters X : observations

Posterior

$$f(X, \theta) = N_{\mu, \Sigma}(\phi(X, \theta)) | J_{\phi}(X, \theta) |$$

f the Neural estimator and ϕ the stochastic flow

- $P(\theta | X)$ approximated through “Neural Posterior” estimators
- $P(X | \theta)$ approximated through “Neural Likelihood” estimators
- $\frac{P(X | \theta)}{P(X)}$ approximated through the “Neural ratio” estimators

Simulation-Based Inference: Automatic Posterior Transformation (Greenberg et al 2019)

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

θ : parameters X : observations

- $P(\theta | X)$ approximated through “Neural posterior” by a flow $Q_{F(x_0, \phi)}(\theta)$

- Loss function:

$$\tilde{q}_{x, \phi}(\theta) = q_{F(x, \phi)}(\theta) \frac{\tilde{p}(\theta)}{p(\theta)} \frac{1}{Z(x, \phi)}, \quad (2)$$

- Where a proposal posterior is

$$\tilde{p}(\theta | x) = p(\theta | x) \frac{\tilde{p}(\theta) p(x)}{p(\theta) \tilde{p}(x)}$$

Algorithm 1 APT with per-round proposal updates

Input: simulator with (implicit) density $p(x|\theta)$, data x_o , prior $p(\theta)$, density family q_ψ , neural network $F(x, \phi)$, simulations per round N , number of rounds R .

```

 $\tilde{p}_1(\theta) := p(\theta)$ 
for  $r = 1$  to  $R$  do
  for  $j = 1$  to  $N$  do
    Sample  $\theta_{r,j} \sim \tilde{p}_r(\theta)$ 
    Simulate  $x_{r,j} \sim p(x|\theta_{r,j})$ 
  end for
   $\phi \leftarrow \underset{\phi}{\operatorname{argmin}} \sum_{i=1}^r \sum_{j=1}^N -\log \tilde{q}_{x_{i,j}, \phi}(\theta_{i,j})$     using (2)
   $\tilde{p}_{r+1}(\theta) := q_{F(x_o, \phi)}(\theta)$ 
end for
return  $q_{F(x_o, \phi)}(\theta)$ 

```

Simulation-Based Inference: Sequential Neural Likelihood (Papamakarios et al 2019)

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

θ : parameters X : observations

Posterior

- $P(X | \theta)$ approximated through “Neural likelihood” by a flow $Q_\phi(X | \theta)$

Algorithm 1: Sequential Neural Likelihood (SNL)

Input : observed data \mathbf{x}_o , estimator $q_\phi(\mathbf{x} | \theta)$,
number of rounds R , simulations per
round N

Output: approximate posterior $\hat{p}(\theta | \mathbf{x}_o)$

set $\hat{p}_0(\theta | \mathbf{x}_o) = p(\theta)$ and $\mathcal{D} = \{\}$

for $r = 1 : R$ **do**

for $n = 1 : N$ **do**

 sample $\theta_n \sim \hat{p}_{r-1}(\theta | \mathbf{x}_o)$ with MCMC

 simulate $\mathbf{x}_n \sim p(\mathbf{x} | \theta_n)$

 add (θ_n, \mathbf{x}_n) into \mathcal{D}

 (re-)train $q_\phi(\mathbf{x} | \theta)$ on \mathcal{D} and set

$\hat{p}_r(\theta | \mathbf{x}_o) \propto q_\phi(\mathbf{x}_o | \theta) p(\theta)$

return $\hat{p}_R(\theta | \mathbf{x}_o)$

Simulation-Based Inference: Neural Ratio (Hermans et al 2020)

$$P(\theta | X) = \frac{\overset{\text{Likelihood}}{P(X | \theta)} \overset{\text{Prior}}{P(\theta)}}{\underset{\text{Evidence}}{P(X)}}$$

θ : parameters X : observations

Posterior

- $P(X | \theta) / P(X)$ approximated through “Neural ratio” by a flow $d_\phi(X | \theta)$

Algorithm 1 Optimization of $d_\phi(\mathbf{x}, \theta)$.

Inputs: Criterion ℓ (e.g., BCE)
 Implicit generative model $p(\mathbf{x} | \theta)$
 Prior $p(\theta)$

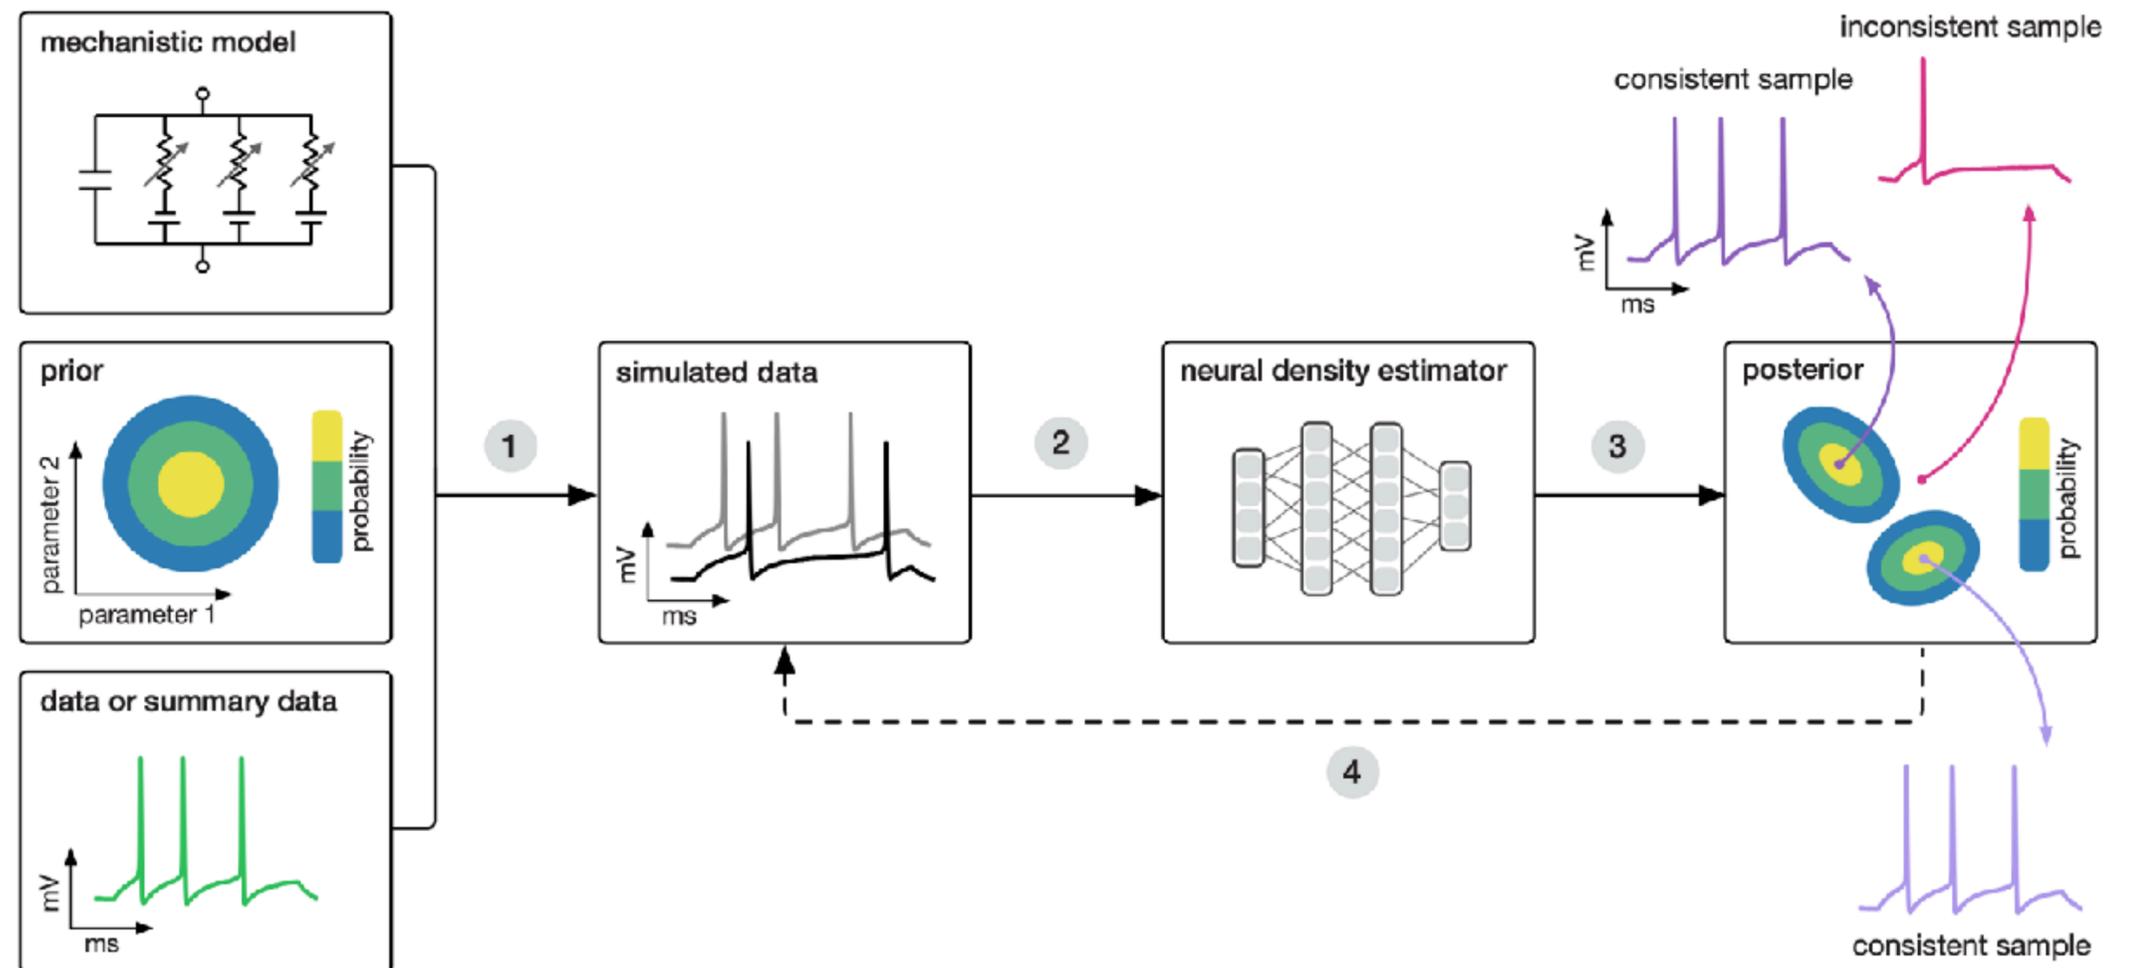

Outputs: Parameterized classifier $d_\phi(\mathbf{x}, \theta)$

Hyperparameters: Batch-size M

- 1: **while not converged do**
- 2: **Sample** $\theta \leftarrow \{\theta_m \sim p(\theta)\}_{m=1}^M$
- 3: **Sample** $\theta' \leftarrow \{\theta'_m \sim p(\theta)\}_{m=1}^M$
- 4: **Simulate** $\mathbf{x} \leftarrow \{\mathbf{x}_m \sim p(\mathbf{x} | \theta_m)\}_{m=1}^M$
- 5: $\mathcal{L} \leftarrow \ell(d_\phi(\mathbf{x}, \theta), 1) + \ell(d_\phi(\mathbf{x}, \theta'), 0)$
- 6: $\phi \leftarrow \text{OPTIMIZER}(\phi, \nabla_\phi \mathcal{L})$
- 7: **end while**
- 8: **return** d_ϕ
